

A FULL RANGE OF PRODUCTION CAPABILITIES

The Precision Medical Converting Group (PMCG) at LasX Industries has established itself as a process-driven, quality production resource for the contract manufacturing of medical components. This approach allows medical device manufacturers to focus on their core competencies critical to company growth. The primary focus of the PMCG is to develop innovative processes solutions which enable the manufacturing of high quality medical components using digital converting technology.

PROCESS

The PMCG offers high speed *LaserSharp*® digital converting capabilities for the production of high tolerance medical device components. Servo-driven equipment and optical technology allow LasX to deliver precisely aligned multilayer assemblies with unsurpassed accuracy. Manufacturing is done in either roll-to-roll or sheet formats in a climate controlled facility.

In order to fully manage your various production needs, the PMCG also offers assistance with material purchasing, material management, and inventory control. These processes are incorporated into the PMCG's *Quality Management System*, which includes an ISO 9001:2008 certification. The PMCG offers a single source program management solution through its collaboration with other related manufacturers. The result is a complete assembly or sub-assembly component from start to finish, to meet your outsourcing requirements.

When your project requirements fall outside of our core competencies, the PMCG has established **partnerships** for:

- Screen-printing conductive and non-conductive inks in sheet or web formats
- Product assembly, including gel insertion, at FDA registered facilities
- Product packaging at FDA registered facilities

These capabilities allow the PMCG to offer a wide range of services to the in-vitro diagnostic, microfluidic and medical flex-circuit markets. By offering a full range of production capabilities, you can determine the extent of services necessary for your specific project.
